

Airline Flight Reservation/Purchasing System

I. Login System

1. Customers must log in using pre-defined credentials:
 - USERNAME: STUDENT | PASSWORD: TAFT2401
 - USERNAME: ADMIN | PASSWORD: FLYHIGH
 - USERNAME: TRAVELER | PASSWORD: SKYWAY
2. Include error handling for invalid login attempts (up to 3 tries).

II. Flight Information

1. Customers can view international flight schedules:
 - Flight ID, departure and arrival times, destination (at least 5 countries, with at least 5 schedule), available seats, and fare.
2. Predefined flights with data stored in arrays, including seat availability.

III. Reservation System

1. Customers can choose a flight, specify the number of tickets, and reserve seats if available.
2. If requested seats exceed availability, display an appropriate message.

IV. Transaction Summary

1. After selecting flights, show a summary with details:
 - Flight name, destination, tickets reserved, and the total cost (including discounts).
2. Ask for confirmation to finalize the booking or restart the process.

V. Payment Handling

1. Customers can enter the total payment and receive change if necessary.
2. Handle scenarios where the payment is insufficient.

VI. Discounts

1. Apply discounts for eligible categories:
 - Senior Citizen/PWD (20%)
 - Manager's Discount (30%)

2. Allow customers to indicate if they qualify for a discount and validate their choice.

VII. Receipt Generation

Generate a receipt displaying:

- Customer name, flight details, ticket quantity, discounts applied, total cost, payment, and change.

Parameters

Your software must have the following C language topics ONLY: Basic I/O statements of C language, any Conditional Statements, any Looping Statements (for, while, or do-while loop), void functions, functions pass by value, any string functions, and one-dimensional array.

Reminders:

Use of chatgpt and other AI applications are not allowed. AI checker and plagiarism checker are activated on Canvas submissions.

Write your own program and upload your *.c file here.

Do not include other topics of C-language not discussed (e.g pointers, memory allocation, structure, functions pass by reference, etc).

Submitting work that is entirely generated by AI and claiming it as their own is considered academic dishonesty and will have serious consequences. Academic integrity requires that we use AI responsibly and ethically, ensuring that our work reflects our own understanding and intellectual contributions.

Following the [DLSU Student Handbook Section 5.3.1.1](#), any instance of academic dishonesty shall be considered a major offense.
